## OBJECTIVE

The objective of developing a **Pharmacy Management System** is to design and implement an efficient, secure, and user-friendly software solution that automates and optimizes various processes involved in managing a pharmacy. The system will focus on streamlining prescription workflows, ensuring accuracy, and enhancing overall operational efficiency. Below are the detailed objectives:

# PROJECT INTRODUCTION

A **Pharmacy Management System (PMS)** is a specialized software solution designed to manage and streamline the operations of a pharmacy. With the increasing complexity of healthcare services and the growing demand for accurate and efficient prescription management, a PMS serves as an essential tool for pharmacists to enhance their services. This system automates key processes such as prescription handling, inventory management, billing, and record-keeping, ensuring that pharmacies can operate .

# PROBLEM STATEMENT

The **Pharmacy Management System** aims to address the inefficiencies and errors in manual management of medicines and related operations in a pharmacy. This system provides an easy-to-use graphical interface to manage medicine records, including adding, updating, deleting, and viewing details in a tabular format

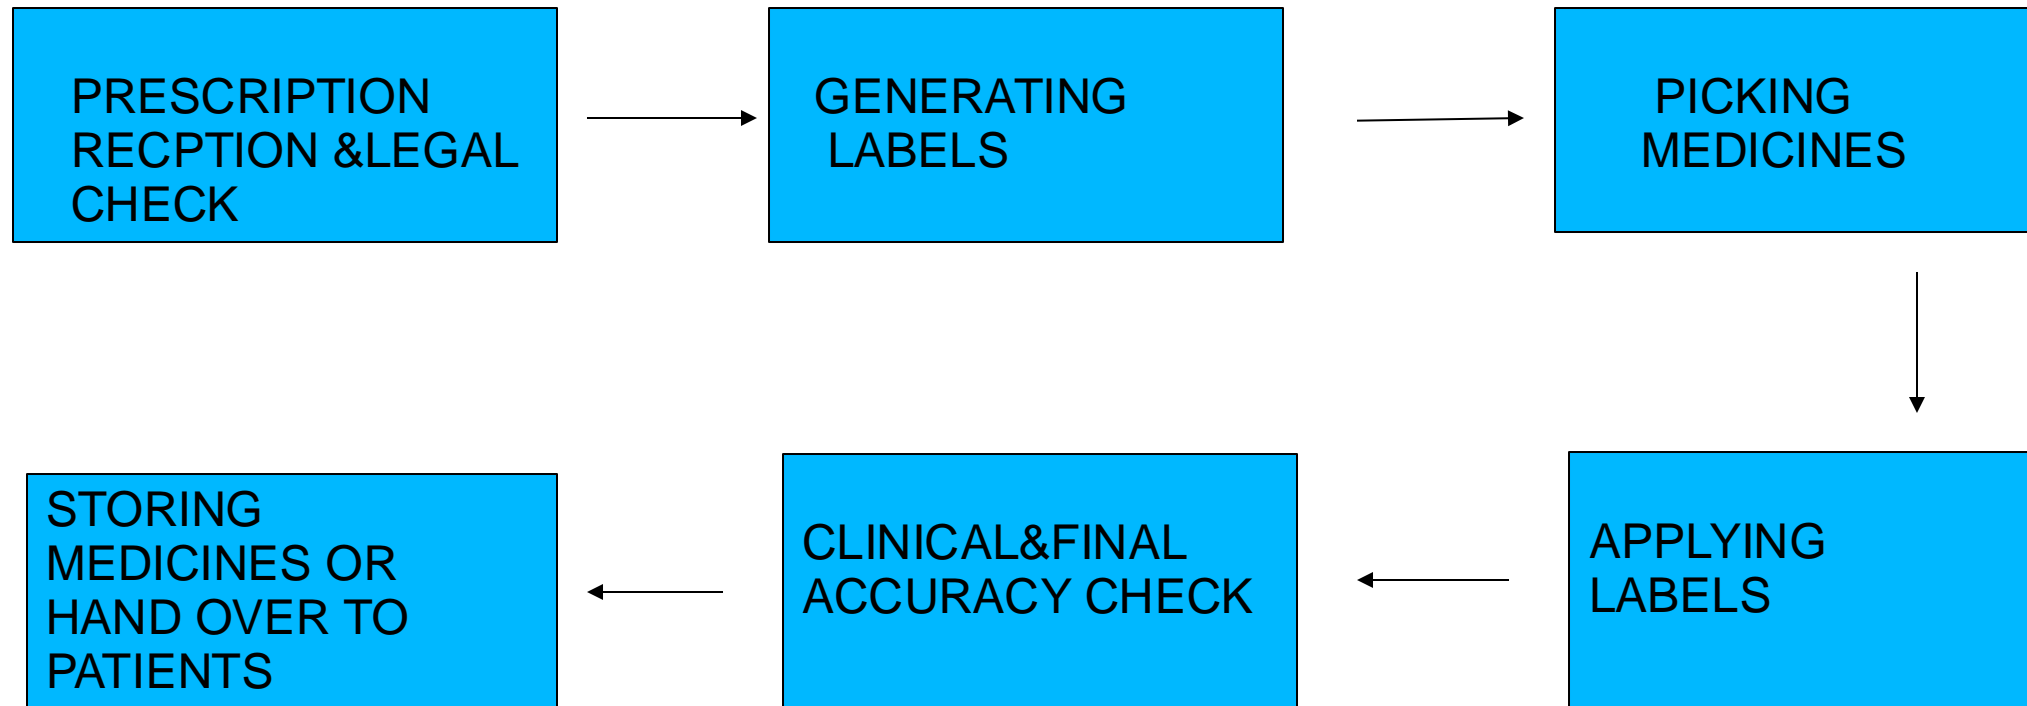

# METHODOLOGIES

1. Object-Oriented Programming (OOP)
2. GUI Development with Java Swing
3. Event-Driven Programming
4. Data Validation
5. Tabular Data Management

# ARCHITECTURE OF THE PROPOSED SYSTEM

# LIST OF MODULES

- **Prescription Module:** Information or learning material about prescriptions. Building or integrating a prescription management system. module for managing prescriptions in a healthcare system.
- **Prescription Management Module:** A Prescription Management Module is a part of healthcare software designed to streamline the creation, tracking, and management of medical prescriptions.
- **User Interaction Module (Main Menu):** A User Interaction Module is a system component designed to facilitate seamless communication and interaction between users and a software application.
- **Data Storage Module:** A Data Storage Module is a core component in any software system, responsible for securely storing, retrieving, and managing data

# MERITS

- 1.Real-Time Record Management
- 2.Improved Accuracy
- 3.User-Friendly Interface
4. Automation of Manual Processes

# RESULTS AND DISCUSSION
